18.	Historical American shad landings (in pounds only) by month for the Rappahannock River, 1973-1987.....	27
19.	Historical American shad landings (in pounds only) by month for the Potomac River, 1973-1987.....	29
20.	Historical American shad landings (in pounds only) by month for unclassified Bay tributaries, 1973-1987.....	31

American shad has ranked as a top twenty species in landings and value for the past 48 years. The ranking of shad has fluctuated greatly and has even reached the top five (1968, 1970). In recent years, shad has ranked between 10 and 20 compared to all species landed in Virginia.

For over half of the past 48 years, Virginia has supplied greater than 75 percent of the American shad landings for the Chesapeake Region. Also, Virginia has historically supplied 75 percent of the dockside value. The highest regional percentage was reached in 1981, when Virginia supplied 99 percent of the landings and dockside value. The only year Virginia supplied less than 50 percent was in 1961.

Historically Virginia has supplied 43 percent or less of the total United States American shad landings. In 1941 Virginia supplied 56 percent of the landings, but only 14 to 16 percent during the last three years. Shad value also peaked in 1941, with Virginia supplying 67 percent; however, the value has been less than 15 percent in the last three years.

From 1940-1987, the peak in landings occurred in 1945 at 5,299,600 pounds and 971,600 dollars (Table 1). Yearly landings averaged well over three million pounds from 1940-50. Since then, there has been a steady decline in pounds landed, and landings averaged less than one million pounds from 1981-87. This represents an actual decrease of 82 percent from the 1940-50 average. The value has also undergone a steady decline and is 68 percent of the 1940-50 average.

Table 2 presents landings by month for Virginia, 1973-1987. For the past 15 years, over 88 percent of the landings have occurred during March and April. In all individual water areas surrounding Virginia, at least 82 percent of the American shad landings have occurred from February to May. These four months are responsible for more than 90 percent of many areas' total landings (Tables 13-20).

From 1974 to 1980, staked gill nets have accounted for the highest percentage of landings by gear type. Pound nets and drift gill nets have alternated as the second highest percentage. From 1981 to 1987, the highest percentage by gear type has alternated between staked gill nets and drift gill nets (Table 3).

The Atlantic Ocean had the greatest landings by water area during the last four years. Over the last 15 years, other areas that have shown high landings have been the York River, James River, and the Chesapeake Bay (Table 4).

Note: 1987 landings are preliminary.

Potomac River landings are collected in cooperation with the Potomac River Fisheries Commission.
